

Upstairs Classroom: Light Shelves

Light shelves help light up parts of the classrooms. They are like a pool because they reflect sunlight off them. These shelves are important because they will help keep the rooms lit during the day.

Light shelves will help teachers so they don't have to keep putting the blinds down. Teachers can help students maintain them by reminding them not to hang on them outside.

Light shelves are part of the LEED features of Indoor environmental quality and energy efficiency. They help keep the light from not being too bright coming in the windows which helps save energy while improving the indoor environment.

The light shelves are located outside each window. They are angled to direct light so it will bounce off the ceilings and be where it is needed most in the rooms.

If everyone in the whole world would turn off their lights, it would save a ton of electricity. Also, it will help save birds, who are attracted to lights at night and often get injured by flying too close.
